Abstract

The Adelaide Geosyncline is considered as a deformed sedimentary basin located between the Paleoproterozoic Gawler and Curnamona crystalline basement complexes. A suite of Late Neoproterozoic clastic sediments are widely deposited in the Flinders Ranges, South Australia. From the Proterozoic to the Cambrian, this area was a passive margin system. The outstanding exposures in this region allow detailed study of the sedimentary structures of analogous basins around the world, which often contain similar styles of source rocks and petroleum reservoirs. The Bonney Sandstone in the Northern Flinders Ranges is the lower part of the coarser, shallow-marine Pound Subgroup. This project provides an opportunity to examine relatively undescribed strata in this area. During the fieldtrip, my investigation consists of two detailed measured stratigraphic sections, which reveal a few well-preserved primary sedimentary structures. Many detailed sedimentological analysis were done during the study, including the measurement of strata and petrography. Several lithofacies were summarized and the associations of them were discovered. The characteristics of sedimentation are influenced by the paleocurrent, sediment supply and basin development. Both the modelling of this sedimentary process and the palaeogeography of the Neoproterozoic of South Australia are required to better understand the sedimentary character in the Northern Flinders Ranges.

Table of Contents

1.	Introduction.....	1
1.1	Rationale.....	1
1.2	Aims	2
1.3	Objectives	2
2.	Geological setting	4
2.1	Introduction	4
2.2	Tectonic setting.....	4
2.3	Basin evolution	6
2.4	Sedigraphy of Pound Subgroup	9
2.5	Strata boundary observations	13
3.	Method of the project	14
3.1	Field trip data collection	14
3.2	Lithofacies analysis	15
3.3	Thin section analysis	17
3.4	Summary.....	18
4.	Lithofacies Analysis of the Bonney Sandstone Formation	20
4.1	Introduction	20
4.2	Observations.....	20
4.3	Sedimentary and Lithofacies classification.....	23
4.3.1	Massive sandstone (Lithofacies A).....	23
4.3.1.1	Description	23
4.3.1.2	Interpretation.....	24
4.3.2	Planar and low-angle laminated sandstone (Lithofacies B).....	24
4.3.2.1	Description	24
4.3.2.2	Interpretation.....	26
4.3.3	Sandstone with asymmetrical ripples (Lithofacies C).....	26
4.3.3.1	Description	26
4.3.3.2	Interpretation.....	29
4.3.4	Cross-bedded sandstone (Lithofacies D).....	29
4.3.4.1	Description	29
4.3.4.2	Interpretation.....	31

4.3.5	Coarse-grained sandstone (Lithofacies E).....	35
4.3.5.1	Descrip on	35
4.3.5.2	Interpreta on.....	35
4.3.6	Sandstone with a desicca on cracked surface (Lithofacies F).....	36
4.3.6.1	Descrip on	36
4.3.6.2	Interpreta on.....	37
4.3.7	Planar siltstone and shale (Lithofacies G).....	37
4.3.7.1	Descrip on	37
4.3.7.2	Interpreta on.....	38
4.3.8	Sandstone with red cement spots (Lithofacies H).....	39
4.3.8.1	Descrip on	39
4.3.8.2	Interpreta on.....	39
4.3.9	Rip-up clasts sandstone (Lithofacies I).....	39
4.3.9.1	Descrip on	39
4.3.9.2	Interpreta on.....	40
4.4	Lithofacies associa ons	42
4.4.1	Lithofacies associa on 1 (Lithofacies B and G).....	42
4.4.1.1	Descrip on	42
4.4.1.2	Interpreta on.....	43
4.4.2	Lithofacies associa on 2 (Lithofacies G, A, D)	43
4.4.2.1	Descrip on	43
4.4.2.2	Interpreta on.....	43
4.4.3	Lithofacies associa on 3(Lithofacies B, C, D).....	43
4.4.3.1	Descrip on	43
4.4.3.2	Interpreta on.....	44
4.5	Discussion	44
4.6	Summary.....	48
5.	Thin Sec on Descrip ons	49
5.1	Introduc on	49
5.2	Descrip on.....	50
5.2.1	Sample B2B1	50
5.2.2	Sample CRI	50
5.2.3	Sample CRP	53
5.2.4	Sample CRTM.....	53
5.2.5	Sample CRZ-2	53

5.2.6	Summary.....	54
5.3	Discussion	59
6.	Discussion	61
6.1	Sedimentary environment.....	61
6.2	Comparison with previous research.....	61
6.3	Contribution to the oil and gas industry.....	62
6.4	Comparison with the project aims.....	63
7.	Conclusions.....	64
References.....		66
