

**Thinking Style and Health Behaviour:
A Dual-Process Approach to the Prediction of Preventive Health Behaviours.**

Clare Ellen McGuiness

School of Psychology,
The University of Adelaide

A thesis submitted in fulfilment of the requirements for the degree of Doctor of Philosophy

January 2017

CHAPTER 1. Introduction and literature review.	1
1.1. Preamble.....	1
1.2. Literature Review	1
1.2.1. Dual-process models of cognition	1
1.2.1.1. Type 1 processes.....	2
1.2.1.2. Type 2 processes.....	3
1.2.1.3. Mode of operation.....	3
1.2.1.4. The dual-process view of attitudes.	6
1.2.1.5. Individual differences in processing preferences.....	6
1.2.1.6. Domain-specificity of processing.	14
1.2.1.7. Implications of processing type.	16
1.2.2. Dual-process explanations for health behaviour	19
1.2.2.1. A dual-process model applied to health behaviour.....	21

1.2.2.2. Predicting health behaviour from personality.....	23
1.2.2.3. Predicting health behaviour from dual-process personality variables.	24
1.2.2.4. Predicting health behaviour from thinking style and attitudes.	25
1.2.3. Health behaviour.....	27
1.2.3.1. Primary prevention: lifestyle behaviours.	27
1.2.3.2. Secondary prevention: cancer screening.....	28
1.2.3.3. Influencing health behaviour.	31
1.3. Aims of this research.....	32
1.3.1. Chapter 3.....	32
1.3.2. Chapter 4.....	32
1.3.3. Chapter 5.....	32
1.3.4. Chapter 6.....	33
CHAPTER 2. Overview of research methodology, samples, and measures.....	35
2.1. Research design.....	36
2.2. Study 1 (data for Chapter 3).....	36
2.2.1. Parent study method.....	37
2.2.1.1. Procedure.	37
2.2.1.2. Measures.	39
2.2.1.3. Sample.....	39
2.2.1.4. Trial results.....	42
2.3. Study 2 (data for Chapters 4, 5, and 6).....	42

2.3.1. Study 2 method.....	43
2.3.1.1. Power considerations.....	43
2.3.1.2. Procedure.....	44
2.3.1.3. Measures.....	48
2.3.1.4. Sample.....	92

CHAPTER 3. Thinking style as a predictor of men’s participation in cancer screening.....	97
3.1. Preamble.....	97
3.2. Statement of authorship.....	99
3.2.1. Principal author.....	99
3.2.2. Co-author contributions.....	100
3.3. Published paper.....	102
3.4. Abstract.....	103
3.5. Introduction.....	104
3.6. Method.....	108
3.6.1. Materials.....	110
3.6.2. Data analysis.....	110
3.6.3. Measures.....	111
3.6.3.1. Demographic items (baseline survey).....	111
3.6.3.2. Frequency of GP visits (baseline survey).....	112
3.6.3.3. Self-reported screening data (baseline survey).....	112

3.6.3.4. Observed screening data.	113
3.7. Results	114
3.7.1. Structure of the REI.....	115
3.7.2. Association between thinking style and demographic variables	118
3.7.3. Association between thinking style and prostate cancer screening	119
3.7.4. Association between thinking style and colorectal cancer screening	121
3.8. Discussion	122
3.8.1. Implications	124
3.8.2. Strengths and limitations	125
3.8.3. Future directions	126
3.8.4. Conclusions	127
CHAPTER 4. The REIm-13: a brief measure of thinking style.	129
4.1. Preamble.....	129
4.2. Statement of authorship.....	130
4.2.1. Principal author.....	130
4.2.2. Co-author contributions	131
4.3. Paper accepted for publication	133
4.4. Abstract	134
4.5. Introduction	135
4.6. Method	138
4.6.1. Design and participants.....	138

4.6.2. Measures	139
4.6.2.1. Thinking style.	139
4.6.2.2. Personality.	141
4.6.2.3. Procedure	141
4.6.2.4. Data cleaning and analysis.....	142
4.7. Results	143
4.7.1. REIm-13 scores and test-retest reliability	143
4.7.2. Factorial Structure of the REIm	143

Abstract

Dual-process theories propose that cognition involves two different forms of processing: rapid, autonomous, associative type 1 processing, and slower, resource-intensive, more deliberative type 2 processing. Individual differences have been identified in the degree to which people rely on each type of processing, and a measure called the Rational-Experiential Inventory has been used to quantify these preferences — known as thinking style — as two independent variables. People who are high in *experientiality* tend to listen to their gut feelings and intuitions (i.e. type 1 processing) whereas those high in *rationality* are more likely to enjoy and value thinking hard (i.e. type 2 processing). Given the differing strengths of both types of thinking and the robust associations between some personality variables and health behaviour, it is worthwhile investigating the implications of thinking style for health behaviour. The aims of this project were to determine whether self-reported health behaviour was predicted by thinking style, whether it was better predicted by health-specific thinking style, and whether the influence of attitudes over behaviour is moderated by thinking style.

The first study made use of a subset of participants from a previous project ($n = 585$, all males, mean age 61.4 years) to explore the effect of thinking style on male-specific cancer screening behaviour. Rationality explained a small amount of variance in self-reported participation in digital rectal examinations ($r = .11$, $p = .016$). In the second study, $N = 992$ adults (54.1% female; mean age 46.5 years) completed an online survey, $n = 510$ of whom took part in a follow-up survey. A short form of the Rational-Experiential Multimodal Inventory was devised and validated, with acceptable results. Next, the short form thinking style items were translated to pertain to the health context, and this measure of health thinking style also demonstrated adequate reliability and validity. Moreover, health thinking

style demonstrated incremental validity over trait thinking style in the prediction of self-reported health behaviour: health rationality predicted variance in diet quality ($\beta = .17, p < .001$), faecal occult blood test participation ($\beta = .20, p = .001$), and pap smear participation ($\beta = .14, p = .008$), while health intuition predicted variance in faecal occult blood test participation ($\beta = .20, p = .001$). Finally, limited evidence was found to support the proposal that health rationality moderates the influence of explicit attitudes — and health intuition moderates the influence of implicit attitudes — over health behaviour. However, results diverged from expectations: moderations operated in an unexpected manner and both health rationality and health intuition moderated the prediction of diet quality by explicit attitudes.

This suite of results suggests that thinking style can explain some variance in health behaviour, and aligns with previous suggestions that people alter their thinking style depending on the domain. Health thinking style shows promise as a health psychological measure that can enable better understanding of health behaviour. The results also show that the interaction between thinking styles and attitudes in regards to health behaviour may be more complicated than previously thought.

Declaration

I certify that this work contains no material which has been accepted for the award of any other degree or diploma in my name, in any university or other tertiary institution and, to the best of my knowledge and belief, contains no material previously published or written by another person, except where due reference has been made in the text. In addition, I certify that no part of this work will, in the future, be used in a submission in my name, for any other degree or diploma in any university or other tertiary institution without the prior approval of the University of Adelaide and where applicable, any partner institution responsible for the joint-award of this degree.

I give consent to this copy of my thesis when deposited in the University Library, being made available for loan and photocopying, subject to the provisions of the Copyright Act 1968.

I acknowledge that copyright of published works contained within this thesis resides with the copyright holder(s) of those works.

I also give permission for the digital version of my thesis to be made available on the web, via the University's digital research repository, the Library Search and also through web search engines, unless permission has been granted by the University to restrict access for a period of time.

I acknowledge the support I have received for my research through the provision of an Australian Government Research Training Program Scholarship.

Acknowledgement

I would like to take this opportunity to thank my supervisors Professor Deborah Turnbull, Professor Carlene Wilson and Dr Ian Zajac for their wisdom and support during my candidature. The final product reflects three years of guidance, constructive ideas, and detailed feedback. For all that I have learned through this processes, I am indebted to you.

Thank you to my family, friends, and all those who offered words of encouragement along the way. In particular I feel lucky to have studied alongside and shared an office with a wonderful cast of characters who made candidature all the more enjoyable, and who I preemptively consider to be lifelong friends. I will cherish the memes and the memories — the coffee missions, long chats, my being a bewildered audience to in-depth discussions of *The Bachelor*, and drowning our sorrows at the Staff Club as we watched the victory of President-Elect Trump (mercifully, at the time of writing I don't have to call him the other thing).

Finally, my thanks to my husband Dan: for your endless love and warmth, for the irrepressible fun and creativity you bring to our lives, for being there for me when I need it, and for the good humour with which you will presumably take the lovely dedication page I have prepared (see page xxiv). Our cat Natalie also deserves a mention: if you could comprehend my words, Natalie, I would thank you for your companionship and affection, the pre-dawn wake-ups, your long lists of indecipherable demands, the occasional minor flesh wound, and importantly, for your steadying influence. Nothing is more grounding than scooping cat turds out of a litter box, and such was your dedication to my welfare that you sometimes even demanded I took this self-care moment for myself more than once a day. Thank you.

Funding

During my candidature I was supported by an Australian Government Research Training Program Scholarship. The Freemasons Foundation Centre for Men's Health and CSIRO jointly provided a top-up scholarship, which made life considerably easier. This day-to-day assistance certainly helped the last three years to run more smoothly and is deeply appreciated. In addition to financial support, the professional development activities I was included in at the Freemasons Foundation Centre for Men's Health enabled me to improve my public speaking skills, to be involved in community engagement activities, and provided exposure to varied areas of men's health research. My thanks especially to Mr Robert Clyne, Professor Gary Wittert, and Ms Marg McGee for making all this possible. I am also grateful for the funding received from the School of Psychology that contributed to travel and registration costs for various conferences.

The research undertaken prior to candidature that produced the dataset used in Study 1 was funded by the National Health and Medical Research Council (NHMRC Project Grant number 1026510: Optimising men's uptake of FIT screening for bowel cancer: a population based randomised controlled. 2012. Turnbull D., Wilson, C., Flight, I., Zajac, I.).

Overview

The thesis begins with a review of the literature and a thorough description of the concepts and variables around which the research revolves. The Introduction chapter concludes with statements of the aims of the research. Following this, the methodology of the research is described in more detail than could be included in the papers for publication. Next, four research papers are presented with preambles situating them with regards to the overall aims. I begin by testing for a link between thinking style and cancer screening behaviour in Chapter 3, and in Chapter 4 I prepare for subsequent work by creating a brief form of a recent thinking style measure. In Chapter 5 I use this short measure as a basis for the development of a scale to measure health thinking style, and I investigate its incremental validity in predicting health behaviour. Finally, in Chapter 6 I bring attitudes about health behaviour into the picture, and explore the ways in which they interact with health thinking style in predicting behaviour. The Discussion chapter summarises and integrates the findings, acknowledges the studies' limitations, discusses their implications and provides suggestions for future research.

References for all chapters are collected at the end of the thesis. Likewise, all Appendices are to be found at the end. Table and figure numbering are continuous throughout the document.

Dedication

For Dan and Natalie.
