

Aug 23. 28

CRIPPS'S CORNER,

FOREST ROW,

SUSSEX.

My dear Fisher.

I am inclined to say
I publish it all; but do not
do it if you feel in the least
or very doubtful as a matter
of policy. I have made a
few pencil suggestions, just for
your consideration. They may
not work. Your "These species"
takes one back only to the
"Other New World Species".

I like your poultry story
very much. It is very neat.

The following point does
not arise necessarily out of

Your paper. In the case of a monstrous mutation, not sufficient monstrous as to prevent fertility, but monstrous enough to prevent survival beyond a generation or two, dominance would not arise, if I understand you rightly.

As an example, blindness in most cases. Are there such cases? If not, is it likely that mutations come as it were in series, and the acquired dominance ^{over} the slight mutation is carried over to the big ones? If bad sight-

as a mutant becomes recessive,
might not this become attached
to blindness?

Yours sincerely

L. Dawson
