

October 14th: 1931.

My dear Fisher,

Here are the details as both wanted from Plymouth in regard to heterozygotes in nature. As you will see it is unfortunately defective in certain important respects - ~~especially~~ ~~concerning~~ of the 10 eye-colour genes some remained untested, so as do not know whether these are distinct genes or not.

The data at Plymouth is not always in a very available form. I therefore thought it best to send you the letter and list which I received from Spooner (who works with Mr. Sexton), for you may be able to extract more from it than I can. Though on the whole it seems pretty clear. May I have it back some time - there is no hurry.

So much hope you are getting on all right.

Yours sincerely,
E. B. Ford

OVER

They are not quite sure of the numbers when they talked about it to me. You will see therefore that they differ slightly from those I gave you, though they are approximately the same.
